Induced hydraulic fractures or reactivated natural ... fractures failing in mode I tensile failure may not generate strong enough microseismic signal to be detected via microseismic monitoring methods, so often the microseismic events are interpreted to be the result of a shear failure around the hydraulic fracture or reactivation of intersecting natural fractures [1, 2].

Fracture (geology) - Wikipedia Natural fractures can have very high permeability, and as a result, any differences in hydrostatic balance down the well can result in well control issues. If a higher pressured natural fracture system is encountered, the rapid rate at which formation fluid can flow into the wellbore can cause the situation to rapidly escalate into a blowout, either at surface or in a higher subsurface formation.
