fracture gradient - Schlumberger Oilfield Glossary For example, a fracture gradient of 0.7 psi/ft [15.8 kPa/m] in a well with a true vertical depth of 8000 ft [2440 m] would predict a fracturing pressure of 5600 psi [38.6 MPa]. Hydraulic fracturing - Wikipedia The fracture gradient is defined as pressure increase per unit of depth relative to density, and is usually measured in pounds per square inch, per square foot, or bars. The rock cracks, and the fracture fluid permeates the rock extending the crack further, and further, and so on. What is Fracture Gradient? - Definition from Petropedia Fracture gradient is the slope and pressure required in order to initiate a fracture or a crack into a rock formation. It is necessary to break into the arrangement of the rocks underground, so that conducive channels can be prepared for the oil and gas to flow easily.
